To: "Michael Bove Jr." <ymb@media.mit.edu>

since it looks like the deadline for this is Monday, I'm writing the proposal instead of waiting to see what happens with Samsung.

-----

For my PhD proposal I want to explore new ways of interacting with our mobile devices. This includes a better use paradigm and a richer experience that will demand an interface that can support it.

During the summer I will be looking to develop many different examples of mobile usability with the objective of finding a common thread and a compelling story that will support my PhD proposal. Among the projects I want to look into are exploring other human sensory systems and how we can use them, liberating the interface from the multi-touch screen and using the mobile device to augment human sensory capabilities to sense information that we can't perceive naturally.

-----

It's also a good exercise to try to summarize our thinking. What do you think?

Santiago
